

Amendments to the Abstract:

Please amend the Abstract of the Disclosure section starting at page 54, line 2 and ending at page 54, line 14 to read, as follows.

--An electrophotographic apparatus comprises a photosensitive member, exposing means, and cleaning means for cleaning a residual developer from the photosensitive member, which comprises a cleaning brush brought into contact with the photosensitive member. In this case, [[if]] a brush density of the cleaning brush is  $D$  (number/mm<sup>2</sup>), and an area of a pixel of an electrostatic image is  $S$  (mm<sup>2</sup>/dot), and  $D \times S \geq 0.06$  and  $D \leq 200$  are satisfied. Thus, an image forming apparatus is provided, in which cleaning stability is improved by uniformly scraping off and dispersing the transfer residual developer from the photosensitive member.--
